

CREED ALGO Users Manual

Daily Session Trading • Scaling Program • Profit Scouting

For beginner and advanced traders • manual and automated workflows

Product umbrella: CREED ALGO

Technical stack (MetaTrader 5): GSignalX • ProfitScouter • Opportunity Grader • ProfitHarvest_Now

Publisher: Gocity Group

Important: Trading involves risk of loss. This manual describes software behaviour. It is not investment advice. Always practise on a demo account before live capital.

How to use this manual

If you are	Start here
New to CREED ALGO / MT5	Chapter 3 • Install & first run • Chapter 5 • Beginner automated day
Trading a daily session	Chapter 4 • Daily Session trading
Scaling across pairs	Chapter 7 • Scaling program
Banking profit (scout)	Chapter 9 • Profit Scouting
Advanced / multi-terminal	Chapter 11 • Advanced reference

Callouts used in this guide:

- **Beginner** • do this first; safe defaults.
- **Advanced** • optional power settings; change only when you understand the effect.

1. Welcome to CREED ALGO

CREED ALGO is the trading umbrella for the Gocity **GSignalX** toolkit on MetaTrader 5. It combines:

1. **Signal-driven entries** • follow multi-engine trend direction on each chart you enable (PLAY).
2. **Profit scouting** • watch floating P/L and close positions when a money target is reached (default: one account-wide minimum).
3. **Opportunity grades** (optional) • rank setups across terminals; grades are **advisory only**.

What CREED ALGO does

- Attaches to charts you choose; each chart trades **its own symbol**.
- Opens (or places pending) trades when PLAY is on and entry rules agree.
- Closes profit according to ProfitScouter (automated) or ProfitHarvest_Now (manual one-shot).
- After an account harvest closes everything, charts still on PLAY can **re-enter** if the signal still says buy or sell (march-after-flat).

What CREED ALGO does not do

- Guarantee profit or remove market risk.
- Pyramid / add multiple lots on the **same** symbol ticket (one intended position per chart magic).
- Remotely force other terminals to open or close (grades do not execute trades).
- Replace your broker's risk controls or your own money management.

MT5 names vs CREED branding

CREED ALGO name	What you see in MT5 Navigator
Signal / entry engine	GsignalX_GocityGroup (Expert)
Profit scouting (chart)	ProfitScouter_DollarTarget (Expert)
Profit scouting (24/7)	ProfitScouter_Service (Service)
Opportunity ranks	ProfitOpportunity_Grader (Service)
Manual take-profit sweep	ProfitHarvest_Now (Script)

3.2 MetaTrader checklist

Beginner – do these before any PLAY:

1. **Tools + Options + Expert Advisors** – allow automated trading; allow DLL imports only if your broker/docs require it.
2. Toolbar **Algo Trading** button = **green / ON**.
3. **Navigator + Services** – Add / Start:
 - ProfitScouter_Service (InpBusEnable = true recommended)
 - ProfitOpportunity_Grader (one instance)
4. Open charts for your daily roster; attach GsignalX_GocityGroup on each.
5. On each EA: Common tab + **Allow Algo Trading**.
6. Run deploy\Confirm-After-Start.bat (or Confirm script Gate All).

3.3 First-run defaults that matter

Area	Suggested first setting
GSignalX entry	Limit+Stop bracket, offsets 5 pips (range 4–20)
Drill	Enabled, 10 minutes
ProfitScouter	Scalp ASAP on; InpAccTargetMoney = your minimum take (e.g. 10 account currency)
Scope	All symbols (one Service instance)

4. Daily Session trading

CREED ALGO is built to work cleanly inside a **defined daily window**, not –always on every hour.–

4.1 Broker session vs your hour filter

Control	Default	Role
InpUseSessions	true	Obey broker market session calendar
InpUseHourFilter	false	Optional hard gate on server hours
InpStartHour / InpEndHour	7 / 20	Used when hour filter is ON
InpFridayStop / hour	true / 20	No new FX entries late Friday
InpBlockWeekend	true	No Sat/Sun FX (crypto can be exempt)

Beginner daily session recipe

1. Decide your session (example: London–NY overlap on your broker **server** clock).

2. Set `InpUseHourFilter = true` , `InpStartHour` / `InpEndHour` to that band.
3. Only press **PLAY** when you are watching the session; press **STOP** when done.
4. Keep Friday stop on for FX.

Advanced: leave hour filter off and rely on broker sessions + manual PLAY discipline; use swing band (below) for grade timing only.

4.2 Swing band (grades, not a hard block)

`InpSwingStartHour` / `InpSwingEndHour` (default **12â€”17** server time) mark a preferred window for **opportunity grades**. They do **not** by themselves block entries. For a hard block, use the hour filter or STOP.

4.3 Crypto vs FX

With `InpCryptoAllowWeekend = true` , detected crypto symbols skip FX Saturday/Sunday blocks and Friday flatten rules. Add odd broker symbol names to `InpCryptoExtraList` if needed.

4.4 When to PLAY and STOP

Action	Effect
PLAY	New entries allowed; starts the scalping drill window (if enabled)
STOP	Pauses new entries; pendings cancelled; optional close-all if <code>InpStopClosesAll</code>
CLOSE	Flat this chartâ€™s GSignalX position/pendings now; does not change PLAY/STOP

5. Beginner automated day

Follow this once on **demo**:

1. Start **ProfitScouter_Service** (ASAP account target set to a small demo amount, e.g. 5â€”10).
2. Start **ProfitOpportunity_Grader**.
3. Attach **GSignalX** on 1â€”3 liquid pairs; Algo Trading ON.
4. At session open, press **PLAY** on each chart you want live.
5. Watch panel: Status RUNNING, Drill countdown, Working pendings or Position.
6. When combined floating profit hits the Scouter account target â€™ **all** monitored positions close.
7. If PLAY is still on and the signal still agrees â€™ chart may **re-open** (march-after-flat / drill).
8. At session end â€™ **STOP** on each chart (or leave STOP and let Friday/weekend rules protect FX).

You have just run the full CREED loop: **signal â€™ entry â€™ scout â€™ harvest â€™ optional re-entry**.

6. Manual trading with CREED tools

You can use CREED as a **decision aid** without full automation.

6.1 Discretionary entries

1. Attach GSignalX with Algo Trading allowed **or** use it mainly for panel bias.
2. Read **Last signal**, engine agreement, and **Opp grades**.
3. Place your own market/pending orders if you prefer full manual control.
4. Keep ProfitScouter running so floating profits are still scouted, **or** harvest yourself.

6.2 Manual profit take " ProfitHarvest_Now

1. Drag script ProfitHarvest_Now onto any chart.
2. Set account target (default focuses on **account total**).
3. Confirm; script closes what already meets the target and exits.
4. No trailing and no background loop " ideal for "bank it now."

6.3 CLOSE vs STOP (manual discipline)

- Use **CLOSE** to flatten one symbol without ending the session plan.
- Use **STOP** when you leave the desk so the EA does not arm new drill entries.

7. Scaling program (multi-pair swing entries)

7.1 What "scaling" means in CREED ALGO

Scaling here means **growing or shrinking how many pairs are live**, and **how large each position is**, during the daily session " aligned with swing-quality hours and your account profit target.

It does **not** mean pyramiding (adding ticket after ticket on the same pair). GSignalX keeps **one intended position per symbol/magic**.

7.2 Build a daily roster

1. Choose a short list of liquid pairs (example: majors + one metal).
2. Open one chart per pair; attach GSignalX with the **same magic** only if you intend one strategy family (or different magics to separate strategies).
3. Use **one** ProfitScouter instance with scope **All symbols** (or a symbol list that matches the roster).

7.3 Position sizing

Mode	Input	Use when
Fixed lot	InpRiskMode = Fixed lot , InpFixedLot	Beginners; constant size
Percent risk	InpRiskMode = % of balance , InpRiskPct , ATR stop ON	Scaling risk with account
Cap	InpMaxLot	Hard ceiling per trade

Beginner: fixed small lot.

Advanced: 0.5–1% risk per trade with ATR stop; raise PLAY pair count only when grades/session are strong.

7.4 Scale the program with the session

Session quality	Action
Strong (liquid, swing band, high grades)	PLAY more roster pairs; normal risk %
Average	PLAY core pairs only
Poor / news / late Friday	STOP; reduce or zero new risk
After ASAP harvest	Let march re-enter only on pairs still PLAY + valid signal

7.5 Account target vs open risk

ProfitScouter's **single account minimum** (InpAccTargetMoney) closes **all** floating positions when hit. Plan so that:

- Sum of expected scalp takes ≈ your target, and
- Number of PLAY pairs — risk per pair stays within your daily loss tolerance (set InpAccMaxLossMoney if you want an emergency flatten).

8. Order entry rules

8.1 Entry modes

Mode	Behaviour
Market	Immediate fill
Limit	Pullback from signal bar open
Stop	Breakout from signal bar open
Both (default)	Limit + Stop bracket (OCO: one fill cancels the other)

Offsets: default **5** (typical scalp **4â€"6**); absolute clamp **4â€"20** (pips or points per `InpOffsetUnit`).

`InpPendFromSignalOpen = true` anchors levels to the active signal opening bar, then adjusts for broker minimum distance.

8.2 Scalping drill

Input	Default	Meaning
<code>InpDrillEnable</code>	true	Drill on PLAY
<code>InpDrillMinutes</code>	10	Window length (5â€"15)
<code>InpDrillFollowActive</code>	true	Follow active direction under bot filters
<code>InpDrillAllowReentry</code>	true	Re-enter while drill / flat rules allow
<code>InpDrillMarchAfterFlat</code>	true	After harvest flat, one re-arm if signal still valid

After the window expires, behaviour returns to flip-based entries until the next PLAY.

8.3 Signal filters (custom bot rules)

Entries respect:

- Enabled engines (PP SuperTrend, ATR SuperTrend, SuperBollingerTrend)
- Simple vs Advanced agreement (`InpMinAgree`)
- Optional MA filter
- Allow Long / Allow Short
- Spread, sessions, hour filter, PLAY state

9. CREED ALGO Profit Scouting

Profit scouting is the **exit brain**. It does not open trades.

9.1 Scalp ASAP (default “ recommended for daily sessions)

Setting	Typical value
InpScalpAsapAccountOnly	true
InpAccTargetEnable	true
InpAccTargetMoney	Your minimum take (e.g. 10)
Pos / Sym targets & trails	off
InpWindowEnable	false (no age gate)
InpCheckIntervalMs	500

When **total floating P/L** of monitored positions “ target “ **close everything**. Fast, simple, session-friendly.

9.2 Automated vs manual scout

Method	Best for
ProfitScouter_Service	Unattended daily / VPS
ProfitScouter_DollarTarget EA	Visual dashboard on a host chart
ProfitHarvest_Now	Manual “take it now“

Run **one** scouter scope over the same positions (avoid two instances racing).

9.3 After harvest “ keep the set marching

With GSignalX PLAY + march-after-flat:

1. Scouter closes all at the account min.
2. Chart goes flat.
3. If the signal still says buy or sell “ EA re-enters that pair.
4. Open positions again match the active direction set.

9.4 Advanced “ layered trail harvest

Set `InpScalpAsapAccountOnly = false` and enable per-position / per-pair / account trails if you want give-back logic and age windows (classic 30“60 minute trail band). See `README_ProfitScouter.md`.

10. Safety & risk

Beginner checklist

- ☐ Demo first until you trust PLAY / harvest / STOP behaviour
- ☐ Algo Trading ON only when you intend automation
- ☐ STOP when you leave the screen
- ☐ Account target sized for your account (not vanity numbers)
- ☐ One Scouter instance for "All symbols"

Advanced safeguards

- `InpAccMaxLossMoney` "emergency close-all on floating loss"
- `InpMaxSpreadPt` "skip entries in wide spreads"
- `InpStopClosesAll` "STOP also flats (optional; default off)"
- Separate magics per strategy family

Honest limits

- Slippage, requotes, and broker stops can change fills.
- Grades are scores, not orders.
- Weekend / Friday rules protect FX; verify crypto detection for your symbols.

11. Advanced reference

11.1 GSignalX input groups (cheat sheet)

Group	Purpose
Mode & routing	Simple/Advanced, triggers, start next vs current
Engines	PP / ATR ST / SuperBollinger parameters
Trade management	Long/short, reverse, ATR SL/TP, trail
Entry order type	Market / Limit / Stop / Both; offsets 4"20; signal-open anchor
Scalping drill	Window, re-entry, follow-active, march-after-flat
Money management	Fixed lot or % risk, max lot
Sessions & weekend	Sessions, hour filter, Friday, crypto
Execution	Magic, slippage, max spread, lookback
Panel & bus	PLAY buttons, grades, notifications

11.2 Opportunity grades (bus)

Published under Common Files: `GSignalX\bus\v1\`.

Grader writes `grades/latest.json`. Panel **Opp grades** summarises top ideas.

Scoring rewards agreement, session, swing window, spread health “ **advisory**.

11.3 Verify after deploy

1. Files compiled (0 errors).
2. Services running.
3. GSignalX smiley / panel visible; PLAY works.
4. Bus heartbeats / signal JSON when bus enabled.
5. Scouter closes at target on demo.
6. After close, PLAY chart re-enters if signal still active.

Full gates: `DEPLOYMENT_RUNBOOK.md`.

11.4 Troubleshooting

Symptom	Check
No entries	PLAY? Algo Trading? Hour/session/spread? Drill expired waiting for flip?
Limit/Stop rejected	Offset vs stops level; panel Last action; try 5“6 pips; filling RETURN
No harvest	Scouter running? Scope/magic filter? ASAP target too high?
Double closes	Two Scouters on same positions “ keep one
Grades empty	Bus enable + Grader started + Common Files path

12. Glossary

Term	Meaning
CREED ALGO	Product umbrella for this GSignalX + ProfitScouter toolkit
PLAY / STOP	Per-chart arming of new entries
Drill	Timed window after PLAY for active-signal entries
March-after-flat	Re-arm entry after Scouter (or close) flats the chart
ASAP account target	Close all when total floating P/L hits one minimum
Scaling program	Multi-pair roster + risk sizing; not pyramiding
Swing window	Hour band that boosts opportunity grades (default 12â€"17)
Magic	EA order ID used to own positions/orders
FILE_COMMON bus	Shared JSON fabric across terminals on one Windows user
OCO bracket	Limit + Stop; one fill cancels the other

Appendix A â€" Recommended daily session template

FX majors, server roughly aligned to Londonâ€"NY

Item	Value
Hour filter	ON Â· Start 8 Â· End 17 (adjust to your broker server)
Swing grades	12â€"17
Drill	10 minutes
Entry	Both Â· Limit 5 Â· Stop 5
Risk	Fixed 0.01â€"0.10 lot on demo; then % risk live
Scouter	ASAP Â· Acc target sized to account Â· Interval 500 ms
End of day	STOP all charts; optional Friday flatten
